

alphabet sort

Given a list of numbers, arrange them in the ascending alphabetical order of their textual representation.

Input Format

One line of string input containing all the integers, comma separated.

Constraints

- i. Only positive numbers will be given. Input range is 0 to 100000.
- ii. Duplicate numbers are treated as separate and output must repeat them.
eg. If 2,3,2 is given, it should print Three, Two, Two as output.
- iii. All numbers will be given as a single input from the terminal with comma separated. Spaces if given shall be ignored

Output Format

One line of string output, of the sorted numbers (comma separated)

Sample Input 0

```
2,3,2
```

Sample Output 0

```
3,2,2
```

Explanation 0

The textual representation of 2 & 3 are Two and Three. Lexicographical order is Th followed by Tw. Hence, 'Three' followed 'Two' and since duplicates are to be treated as separate entries, it's printed twice.
