

1. matrix rotation method by 90 degree

2. Matrix $n \times n$ is given, where all elements in any individual row or column are sorted. In such a matrix, we have to find the position of a value in $O(n)$ Time Complexity and $O(1)$ Space Complexity

3. Given a matrix of $M \times N$ elements (M rows, N columns), Print all elements of the matrix in diagonal order in Time Complexity $O(m \times n)$ and Space Complexity $O(1)$

4. print matrix in spiral order without any extra space

5. Sorted matrix (All elements are in sorted) find the given values in $O(\log n)$ time

6. Find the transpose of a matrix

7. Multiplication of given matrix

8. Magic Square Check:

Create a Java function to check if a given matrix is a magic square. A magic square is a square matrix in which the sum of every row, column, and both main diagonals is the same.

9. Saddle Point in a Matrix:

Write a Java function to find and print the saddle point (minimum in its row and maximum in its column) in a given matrix.

10 . Print all diagonals elements from given matrices
