Question 1: Zoho coding questions with answers 2023

Problem Statement:

Write a program that receives a word A and some texts as input. You need to output the texts (without modifying them) in the ascending order of the number of occurrences of the word A in the texts. The input is as follows: an integer M(between 1 and 100, inclusive), followed by the word A in the next line, and some text in each of the M next lines.

Note 1: The texts and the word A contain only lowercase Latin letters (a,b,c...,z) and blank spaces (" "). The maximum size of the texts and the word A is 100 Characters. Every text has a different number of occurrences of the word A

Get A Job Abroad In 90 Days

ance from Sandeep Khaira would ensure

Note 2: you must print one text per line without modifying the texts.

Example 1

Input: 2

Java

I hate java

Python is a good programming language

Example 2

Input: 3

python

I like to code in python

python is named after a show name monty python and not after the snake python

I think python is good i think python is important than php

Output: i like to code in python

i think python is good i think python is important than php

python is named after a show name monty python and not after the snake python

Solution of Question 1 in JAVA:

```
import java.util.*;
public class Main
{
    static int countOccurrences(String str, String word)
    {
        String a[] = str.split(" ");
        int count = 0;
        for (int i = 0; i < a.length; i++)
        {
            if (word.equals(a[i]))
                count++;
        }
        return count;
    }
    public static void main(String[] args)
    {
        Scanner sc=new Scanner(System.in);
        int n=sc.nextInt();
        sc.nextLine();
        String word=sc.next();
        //System.out.println(word);
        sc.nextLine();
        String arr[]=new String[n];
        for(int i=0;i<n;i++)
        {
            arr[i]=sc.nextLine();
            //System.out.println(arr[i]);
        }
        TreeMap<Integer,String> map=new TreeMap<Integer,String>();
        for(int i=0;i<n;i++)
        {
```

```

^Iterator itr=s.iterator();
while(itr.hasNext())
{
Map.Entry m=(Map.Entry)itr.next();
System.out.println(m.getValue());
}
}
}

```

Solution of Question 1 in C++:

```

#include<bits/stdc++.h>
using namespace std;
string s;
map<string,int> m2;
bool cmp(pair<string, int>& a,
pair<string, int>& b)
{
return a.second < b.second;
}
void sort(map<string, int>& M)
{
vector<pair<string, int> > A;
for (auto& it : M) {
A.push_back(it);
}
sort(A.begin(), A.end(), cmp);
for (auto& it : A) {
for(int i=0;i<m2[it.first];i++)
cout << it.first <<endl; } } int count(string s1) { istringstream ss(s1);
int
c=0; while(ss) { string w; ss>>w;
if(w==s) c++;
}
return c;
}
int main()
{
int n;getline(cin,s);n=stoi(s);
getline(cin,s);
transform(s.begin(),s.end(),s.begin(),::tolower);
vector<string> v(n);
vector<int> a(n);

```

```
getline(cin,v[i]);
transform(v[i].begin(),v[i].end(),v[i].begin(),::tolower);
m2[v[i]]++;
m[v[i]]=count(v[i]);
}
sort(m);
}
```

Question 2: zoho previous year programming questions

Problem Statement:

Get A Job Abroad In 90 Days

ance from Sandeep Khaira would ensure

Write a program that will print the sum of diagonal elements of a 10X10 matrix. The program will take a total of 100 numbers as input (10 numbers will be input per line and each number will be separated by a space).

Example 1

Input: 1 2 3 4 5 6 7 8 9 0

0 1 2 3 4 5 6 7 8 0

3 4 5 6 7 8 9 6 4 0

2 3 4 5 6 7 8 9 3 2

3 4 5 6 7 4 3 2 1 3

3 4 5 6 2 4 4 2 4 6

2 3 4 6 2 4 6 2 3 5

2 3 5 6 2 4 6 2 3 5

2 4 6 2 1 4 3 3 5 2

3 3 5 2 4 6 2 1 4 6

Output: 42

Get A Job Abroad In 90 Days

Guidance from Sandeep Khaira would ensure

Example 2

Input: 1 22 33 44 55 66 77 88 99 100

100 1 88 77 66 55 44 33 22 11

88 88 1 66 55 44 33 22 11 100

88 77 66 1 44 33 22 11 100 99

77 66 55 44 1 22 11 88 99 100

66 55 44 33 22 1 77 88 99 100

44 33 22 11 100 99 1 77 66 55

33 22 11 100 99 88 77 1 55 44

22 11 100 99 88 77 66 55 1 33

100 11 22 33 44 55 99 88 77 1

Output: 10

Solution of Question 2 in Java:

```
import java.util.*;
public class Main
{
    public static boolean isVowel(char ch)
    {
        return ch=='a' || ch=='e' || ch=='o' || ch=='i' || ch=='u' || ch=='A' ||
        ch=='E' ||
        ch=='I' || ch=='O' || ch=='U';
    }
    public static void main(String[] args)
    {
        Scanner sc=new Scanner(System.in);
        String str=sc.next();
        char arr[]=str.toCharArray();
        String res="";
        if(!isVowel(arr[0]))
            res+=arr[0];
        for(int i=1;i<arr.length;i++)
        {
            if(isVowel(arr[i])&&isVowel(arr[i-1]))
```

```
^}  
    System.out.println(res);  
}
```

Solution of Question 2 in C++:

```
#include<bits/stdc++.h>  
using namespace std;  
int main()  
{  
    vector<vector<int>> v(10,vector<int>(10));  
    for(int i=0;i<10;i++)  
        for(int j=0;j<10;j++) cin>>v[i][j];  
    int sum=0;  
    for(int i=0;i<10;i++)  
        sum+=v[i][i];  
    cout<<sum;  
}
```

Solution of Question 2 in Python:

```
l=['a','e','i','o','u','A','E','I','O','U']  
s=input()  
s+=" "  
s1=""  
if len(s)==0:  
    print("")  
elif len(s)==1:  
    if s[0] not in l:  
        print(s)  
    else:  
        if s[0] in l and s[1] in l:  
            s1+=s[0]  
        elif s[0] not in l :  
            s1+=s[0]  
        for i in range(1,len(s)-1):  
            if s[i-1] not in l and s[i] in l and s[i+1] not in l:  
                continue  
            s1+=s[i]  
        print(s1)
```

Write a program that will take one string as input. The program will then remove vowels a, e, i, o, and u (in lower or upper case) from the string. If there are two or more vowels that occur together then the program shall ignore all of those vowels.

Example 1

Input: Cat

Output: Ct

Example 2

Input: Compuuter

Output: Cmpuutr

Solution of Question 3 in C++:

```
#include<bits/stdc++.h>
using namespace std;int main()
{
    string s;
    int c=0;
    getline(cin,s);
    for (auto i:s)
    {
        if(i=='(') c++;
        if(i==')') c--;
    }
    cout<<(c==0);
}
```

Solution of Question 3 in Python:

```
s=input()
c=0
for i in s:
    if i =='(':
        c+=1
    elif (i==')') and c>0 :
        c-=1
print(int(c>0))
```

^
accept input in two lines. First-line contains a number indicating the total number of integers in the list and the second line contains integers separated by spaces.

Example 1

Input: 5

4 6 9 3 7

Output: 3 7

Example 2

Input: 10

8 10 3 12 7 15 11 2 17 26

Output: 3 7 11 2 17

Solution of Question 4 in C++:

```
#include<bits/stdc++.h>
using namespace std;
map<int,int> m;
bool ifPrime(int a)
{
    if(m[a]==2||m[a]==1) return m[a]-1;
    if((a&1)==0) {m[a]=1;return false;}
    for(int i=3;i<=sqrt(a);i+=2)
        if(a%i==0) {m[a]=1;return 0;}
    m[a]=2;
    return 1;
}
int main()
{
    m[2]=2;
    int n,a;cin>>n;
    for(int i=0;i<n;i++)
    {
        cin>>a;
        if(ifPrime(a)) cout<<a<<" ";
    }
}
```

Solution of Question 4 in Java:

```
import java.util.*;
public class Main
{
    public static boolean isPrime(int n)
```

```
^if(n==2 || n==3)
    return true;
if(n%2==0 || n%3==0)
    return false;
for(int i=5;i<=Math.sqrt(n);i=i+6)
{
    if(n%i==0 || n%(i+2)==0)
        return false;
}
return true;
}
public static void main(String[] args)
{
    Scanner sc=new Scanner(System.in);
    int n=sc.nextInt();
    int arr[]=new int[n];
    for(int i=0;i<n;i++)
        arr[i]=sc.nextInt();
    ArrayList prime=new ArrayList<>();
    for(int i=0;i<n;i++)
        if(isPrime(arr[i]))
            prime.add(arr[i]);
    Iterator itr=prime.iterator();
    while(itr.hasNext())
    {
        System.out.print(itr.next()+" ");
    }
}
}
```
