

Regex Matcher 1

Given an input string *s* and a pattern *p*, implement regular expression matching with support for '.' and '*' where:

'.' Matches any single character.

'*' Matches one or more of the preceding element. The matching should cover the entire input string (not partial).

Input Format

Line1: Word to match
Line2: Pattern to check

Constraints

1 <= s.length <= 10

1 <= p.length <= 10

s contains only lowercase English letters.

p contains only lowercase English letters, '.', and '*'.

It is guaranteed for each appearance of the character '*', there will be a previous valid character to match.

Output Format

true or false

Sample Input 0

```
aa
a
```

Sample Output 0

```
false
```

Explanation 0

"a" does not match the entire string "aa"

Sample Input 1

```
aa
a*
```

Sample Output 1

```
true
```

Explanation 1

'*' means zero or more of the preceding element, 'a'. Therefore, by repeating 'a' once, it becomes "aa".

Sample Input 2

```
ab  
.*
```

Sample Output 2

```
true
```

Explanation 2

"." means "zero or more () of any character (.)".
