

1. Given a positive integer n , round the given number to the nearest multiple of 10.

Input : 4722
Output : 4720

Input : 38
Output : 40

Input : 10
Output : 10

2. Given an array of n integers where $n > 1$, return an array output such that $\text{output}[i]$ is equal to the product of all the elements of array except that element. solve it in $O(n)$.

Input: [1,2,3,4]
Output: [24,12,8,6]

Input: [1,0,5,2]
Output: [0,10,0,0]

3. Given an array of numbers, find the number which is closest to average of the array elements without sorting the array.

Input: [1,2,3,4,5]
Output: 3
Explanation: Average is 3. Closest is also 3.

Input: [17, 42, 9, -28, 6, 2, 7]
Output: 7
Explanation: Average is 8. Closest to 8 is 7 or 9. (printing one is sufficient)

4. Check if the frequency of all characters in the given string are equal, when you remove exactly one character from the string.

Example 1:

Input : cdcddca

Output : true

Explanation : if "a" is removed, "c and d" will have the same frequency of 3.

Example 2:

Input : aaabbbcc

Output : false

Explanation : Frequency of the characters in the given string wont be equal if any 1 char is removed.

5. Given an array of n integers and an integer k, find two integers in the array such that the sum is closest to k. Return the sum of the two integers.

Input: arr = [1,2,0,1], k = 6

Output: 3

Explanation: The sum that is closest to the k is 3. ($1 + 2 = 3$).

Input: arr = [-1,-4,0,2], k = 1

Output: 1

Explanation: The sum that is closest to the k is 1. ($-1 + 2 = 1$).
